

Major Issues of Artificial Intelligence in Security, Media, Responsibility and E-Governance.

In the Chief Guest address, Air Marshal Mateshwaran speech, addressed the breakneck pace of development of Artificial Intelligence and its growing significance in the contemporary security and war. He raised the example of systems of defense, surveillance, and strategy making under the impact of AI technologies.

Air Marshal Mateshwaran believes that AI can contribute to significant advancement of national security by enhancing its intelligence analysis, automation, and predictivity potential. Nevertheless, he also brought significant issues with the morality aspect of the use of AI in warfare. The autonomous systems which are used in military operations cast serious doubts on accountability, control by human beings, and safeguarding of human rights.

He also pointed out that as much as AI has a strong ability to offer high-level technological benefits, the ethical accountability of such use should be thought about by governments and organizations. The issue of striking the equilibrium between technological progress and preservation of basic human values is a hot topic in the shaping of AI-based defence systems.

Keynote on AI in Media

In his keynote address, Nagaraj Nagabushnam from The Hindu Group discussed the growing role of Artificial Intelligence in modern media and journalism..

He has mentioned AI as a not-seen-bureaucrat that operates behind the scenes in online media outlets. There is increased application of AI systems in organizing, recommending, and curating content to readers. The systems are based on algorithms, which assign the promotion or highlighting of the news stories based on the behavior of users, the metrics of engagement and reading.

Mr. Nagabushnam clarified that, although AI is capable of bringing efficiency and personalization to the media platforms, transparency and accountability are also critical concerns that need to be addressed. As algorithms determine the information audiences are exposed to, there is a necessity to make sure that these systems remain fair and do not adversely impact such a course of misinformation and bias dissemination.

He pointed out that AI should be used in responsible ways in the field of journalism, and editorial supervision should be retained as well as making the algorithmic systems transparent and answerable to the audience.

AI in Global South Responsible.

Papia S. Gupta from Jawaharlal Nehru University addressed the challenges of developing Responsible Artificial Intelligence, particularly in the context of the Global South.

Dr. Gupta emphasized that a significant number of AI technologies are created with references to the datasets and frames constructed in Western nations. These systems might not necessarily indicate social, cultural, and economic realities of the developing areas.

She has highlighted that she would focus on the creation of trustful AI systems that focus on fairness, transparency, and inclusiveness. She writes that to be a responsible AI, one needs to pay attention to ethical practice, data privacy, and social concerns of algorithmic decisions.

Another thing that Dr. Gupta emphasized is the necessity of policymakers, researchers, and the developers of AI systems to work together and make sure that these systems can be utilized positively by society at large. It is necessary to create ethical standards and regulations that would oversee the development of AI to make it aligned to the common interest and social justice.

AI in Public Services and E-Governance.

Nila Ganguli from Guru Nanak College discussed the application of Artificial Intelligence in e-governance and public administration. According to Dr. Ganguli, digital governance systems will have a great potential in enhancing the service delivery process by minimizing paperwork, enhancing efficiency of administration and allowing the citizens to access services remotely. Nevertheless, she also identified some possible obstacles like algorithmic bias, which can take place due to the incomplete or prejudiced datasets on which AI systems are based.

To mitigate these issues, she declared the need to create inclusive digital systems that would make equal access to all citizens and most importantly marginalized communities. Close attention and proper ethical management should be involved to make sure that AI-services in the public sector will be equal, transparent, and responsible.

Final Reflections on Artificial Intelligence and Society

Air Marshal Mateshwaran, Nagaraj Nagabushnam, Papia S. Gupta, and Nila Ganguli have all, in their separate discourses, collectively unfolded the story of how Artificial Intelligence is gradually dominant in various spheres of the human society. AI is becoming increasingly indispensable in the modern, day technological landscape, be it for national security and warfare, media systems, governance, or global ethical frameworks.

A datum in all presentations was the critical leverage of technological innovation by ethical considerations. Despite the fact that AI can bring about remarkable improvements like increased productivity, excellent data analytics, and enhanced decision, making capabilities, it can also give rise to issues of human rights, openness, responsibility, and justice. To give a few examples, the security and media realms cannot afford to overlook the necessity of vigilant oversight and prudent governance as far as the possible ways of abuse and/or collateral damages with AI systems are concerned.

As well, the talk on #ResponsibleAI# in the Global South points to the necessity for a collectively beneficial tech development that is socially and culturally aware. The PC transformation of governance is another example where, on the one hand, digital tools can facilitate public service delivery, but on the other hand, there is a pressing issue of preventing them from being vehicles of bias and inequality.

In sum, these meetings have cast light on the fact that AI's future will be a garden where ethical petals, robust regulatory fences, and continuous human caretaking will be the components that make technology flourish in a way that society as a whole reaps the benefits.
